#JSCORE

Document Object Model (DOM)

Traverse the DOM Tree

What is DOM?

- What is **Document Object Model (DOM)**?
 - HTML documents in the browser are stored as "**DOM tree**"
 - Consists of **elements** with **child elements**
 - Elements have **properties** (attribute + value) and **events**
- The **DOM API** allows search / modify the DOM tree

```
let menu = document.getElementById('menu');  
menu.style.display = 'none';  
menu.appendChild(document.createElement('hr'));
```

Selecting HTML Elements from DOM

- Select a single element → returns **HTMLElement**

```
let header = document.getElementById('header');  
let nav = document.querySelector('#main-nav');  
let root = document.documentElement;
```

- Select a collection of elements → returns a **collection**

```
let inputs = document.getElementsByTagName('li');  
let towns = document.getElementsByName('towns[]');  
let header = document.querySelectorAll('#nav li');  
let allLinks = document.links;
```

Accessing Element Text

- The contents of HTML elements are stored in text nodes
 - To access the contents of an element:

```
let element = document.getElementById('main');  
let text = element.textContent; //This is JavaScript!  
element.textContent = "Welcome to the DOM";
```

```
<html>  
  <head></head>  
  <body>  
    <div id="main">This is JavaScript!</div>  
  </body>  
</html>
```

```
<html>  
  <head></head>  
  <body>  
    <div id="main">Welcome to the DOM</div>  
  </body>  
</html>
```

- If the element has children, returns all text concatenated

- To access raw HTML:

```
element.innerHTML = "<p>Welcome to the DOM</p>";
```

```
<html>
  <head></head>
  <body>
    <div id="main">This is JavaScript!</div>
  </body>
</html>
```

```
<html>
  <head></head>
  <body>
    <div id="main">
      <p>Welcome to the DOM</p>
    </div>
  </body>
</html>
```

- This will be parsed – beware of **XSS attacks**!
- Changing **textContent** or **innerHTML** removes all child nodes

Accessing Element Values

- The **values** of input elements are **string properties** on them:

```
<html>
  <head></head>
  <body>
    <div id="main">
      <p>Welcome to the DOM</p>
      <input id="num1" type="text">
    </div>
  </body>
</html>
```

```
type: "text"
useMap: ""
validationMessage: ""
▶ validity: ValidityState
value: "56"
valueAsNumber: NaN
▶ webkitEntries: Array[0]
webkitdirectory: false
width: 0
```

```
let element = document.getElementById('num1');
let num = Number(element.value);
element.value = 56;
```

Problem: Sum Numbers

- Write a JS function to sum two numbers (fill the missing code)

```
<input type="text" id="num1" /> +  
<input type="text" id="num2" /> =  
<input type="text" id="sum" readonly="readonly" />  
<input type="button" value="Calc" onclick="calc()" />  
<script>  
  function calc() {  
    // TODO: sum = num1 + num2  
  }  
</script>
```

5	+
7	=
12	<input type="button" value="Calc"/>

Solution: Sum Numbers

```
function calc() {  
  let num1 = document.getElementById('num1').value;  
  let num2 = document.getElementById('num2').value;  
  let sum = Number(num1) + Number(num2);  
  document.getElementById('sum').value = sum;  
}
```

Check your solution here: <https://judge.softuni.bg/Contests/328>

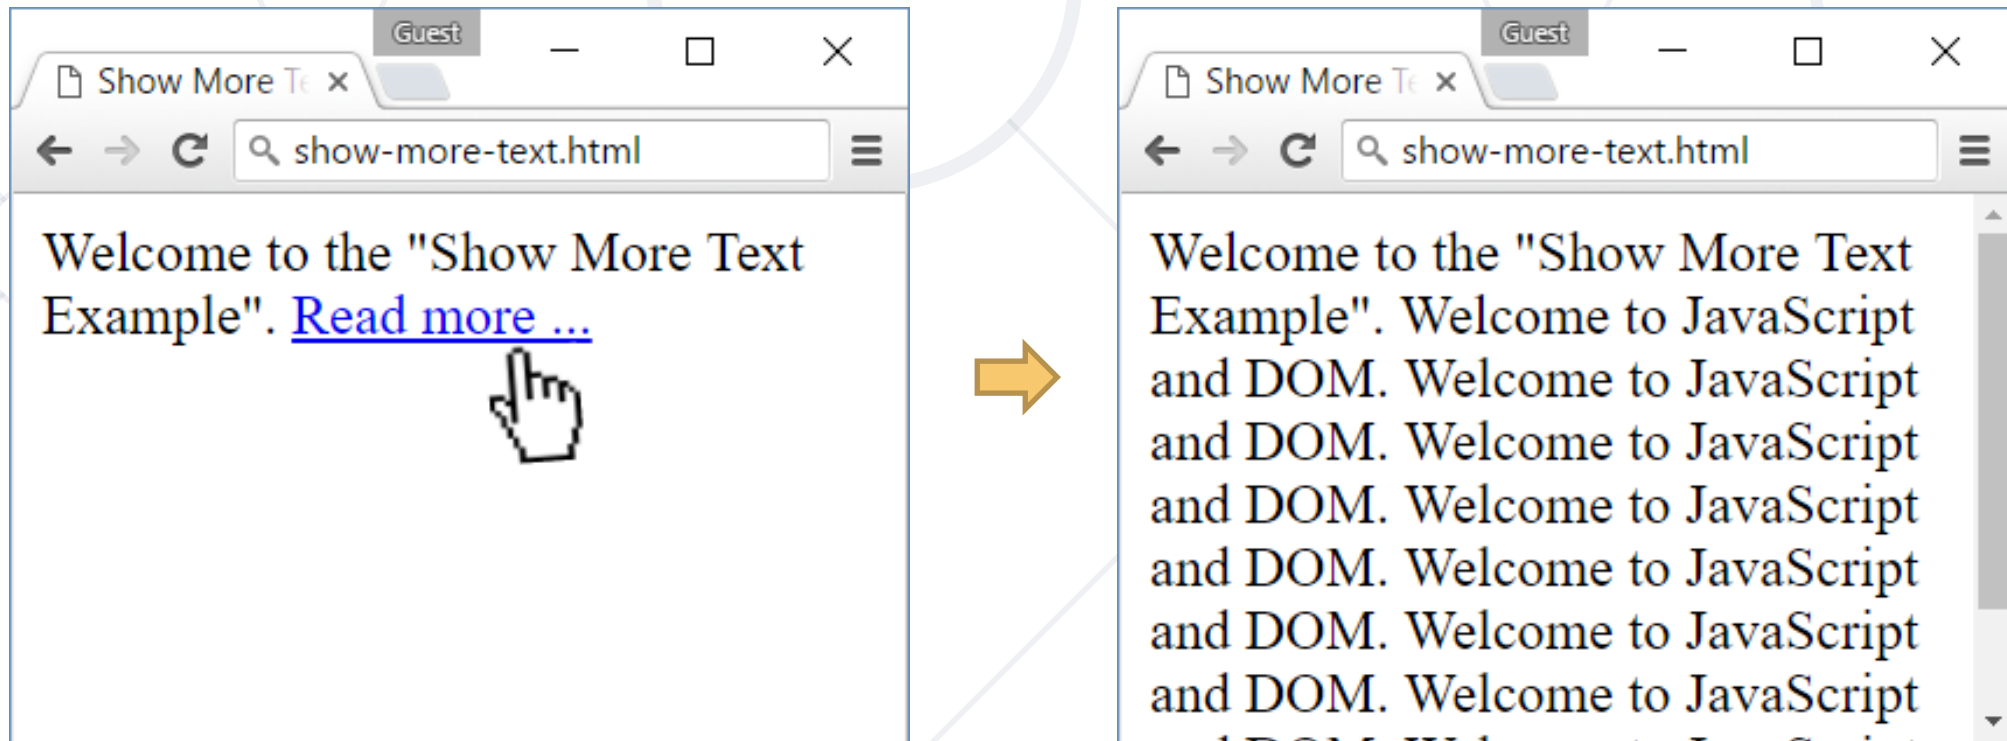

DOM API: Element Properties

```
<div id="first" class="big">First <b>DIV</b></div>
```

```
let div = document.getElementById('first');  
console.log(div.id); // first  
console.log(div.tagName); // DIV  
console.log(div.className); // big  
console.log(div.textContent); // First DIV  
console.log(div.innerHTML); // First <b>DIV</b>  
console.log(div.outerHTML); // <div id="first"  
class="big">First <b>DIV</b></div>
```

First **DIV**

- A HTML page holds a short text + link "*Read more ...*"
 - Clicking on the link shows more text and hides the link

Problem: Show More Text – HTML

Welcome to the "Show More Text Example".

```
<a href="#" id="more" onclick="showText()">Read more ...</a>
```

```
<span id="text" style="display:none">Welcome to ...</span>
```

```
<script>  
  function showText() {  
    // TODO  
  }  
</script>
```

- See the DOM tree here: <http://software.hixie.ch/utilities/js/live-dom-viewer/?saved=4275>

Solution: Show More Text

```
Welcome to the "Show More Text Example". <a href="#"
id="more" onclick="showText()">Read more ...</a>
<span id="text" style="display:none">Welcome to ...</span>
<script>
  function showText() {
    document.getElementById('text')
      .style.display = 'inline';
    document.getElementById('more')
      .style.display = 'none';
  }
</script>
```

Check your solution here: <https://judge.softuni.bg/Contests/328>

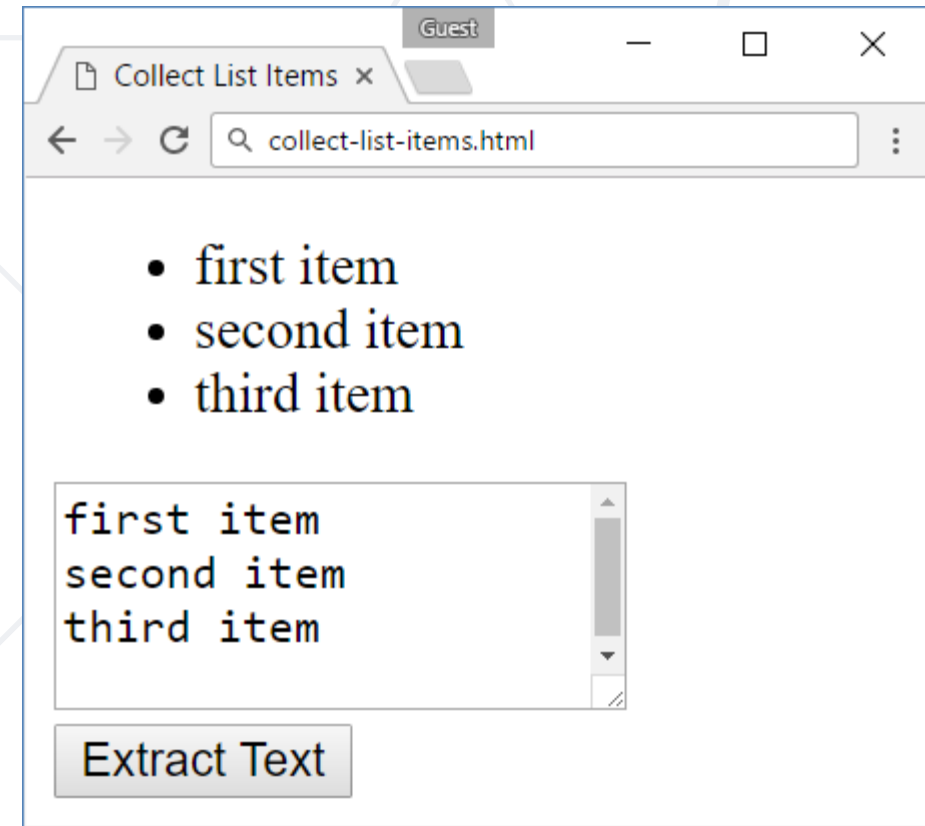

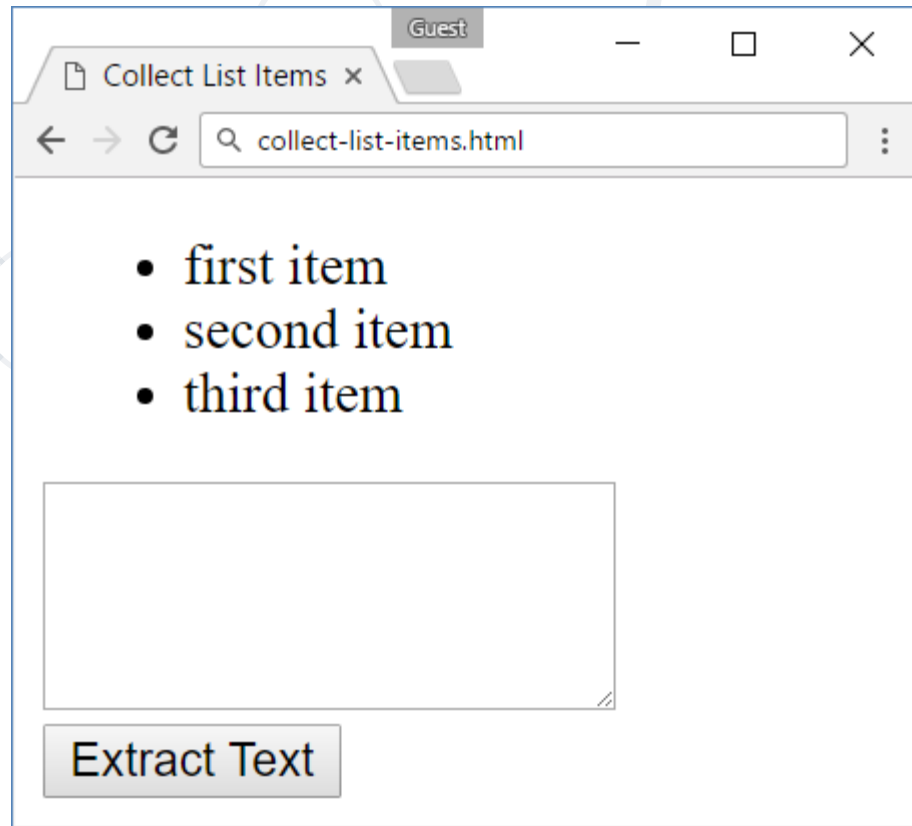

CSS Selectors

- CSS selectors are strings that follow CSS syntax for matching
 - Works with **querySelector** and **querySelectorAll**
 - Base for jQuery operations (helper library)
- They allow very fast and powerful element matching, e.g.:
 - **"#main"** → returns the element with ID "main"
 - **"#content div"** → selects all **<div>**s inside **#content**
 - **".note, .alert"** → all elements with class "note" or "alert"
 - **"input[name='login']"** → **<input>** with name "login"

Problem: Collect List Items

- Collect the **list items** from given HTML list and append their **text** to given **text area**

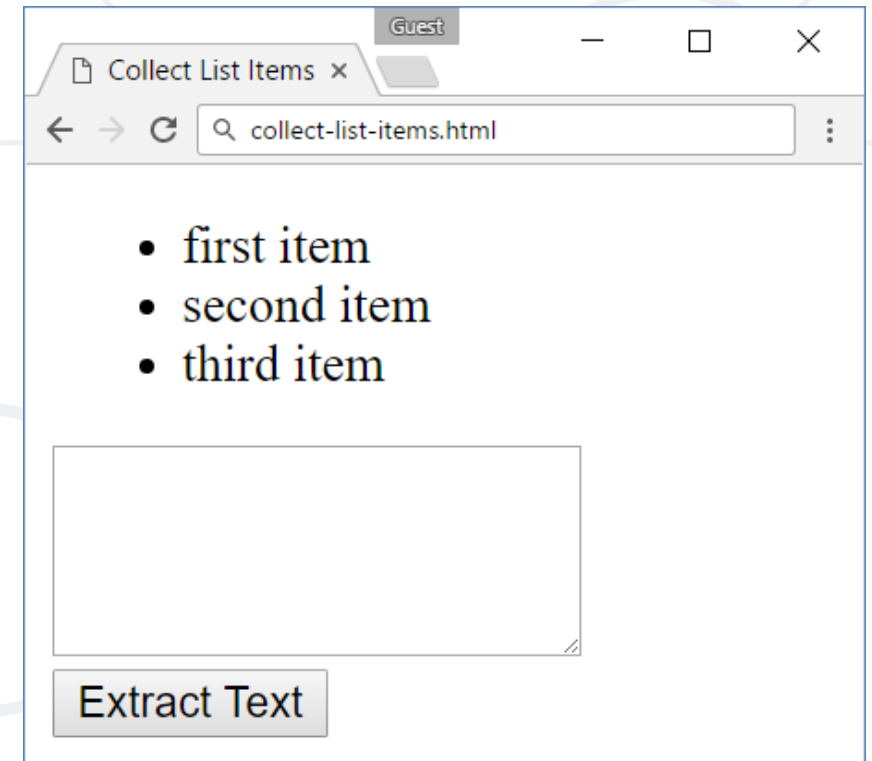

Problem: Collect List Items – HTML

```
<ul id="items">
  <li>first item</li>
  <li>second item</li>
  <li>third item</li>
</ul>

<textarea id="result">
</textarea>

<br>

<button onclick="extractText()">
Extract Text</button>
```

Solution: Collect List Items

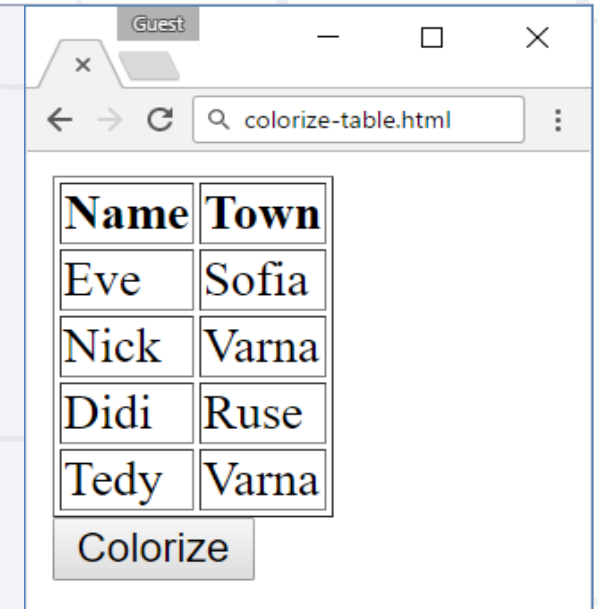

```
function extractText() {  
  let itemNodes =  
    document.querySelectorAll("ul#items li");  
  let textarea =  
    document.querySelector("#result");  
  for (let node of itemNodes) {  
    textarea.value += node.textContent + "\n";  
  }  
}
```

Check your solution here: <https://judge.softuni.bg/Contests/328>

Problem: Colorize Table Rows

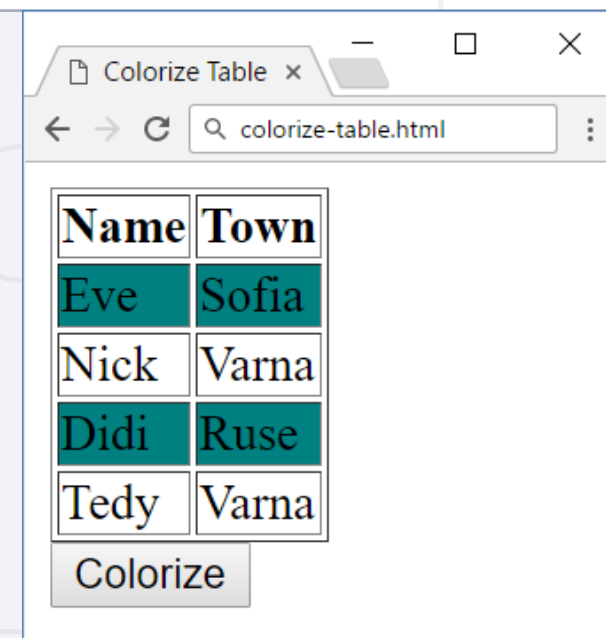

- A HTML page holds a **table** with **rows**
 - On button click, colorize in color "**teal**" all even rows

```
<table border="1">  
  <tr><th>Name</th><th>Town</th></tr>  
  <tr><td>Eve</td><td>Sofia</td></tr>  
  <tr><td>Nick</td><td>Varna</td></tr>  
  <tr><td>Didi</td><td>Ruse</td></tr>  
  <tr><td>Tedy</td><td>Varna</td></tr>  
</table>  
<button onclick="colorizeRows()">Colorize</button>
```

Solution: Colorize Table Rows

```
function colorizeRows() {  
    let rows = document.  
        querySelectorAll("table tr");  
    let index = 0;  
    for (let row of rows) {  
        index++;  
        if (index % 2 == 0)  
            row.style.background = "teal";  
    }  
}
```

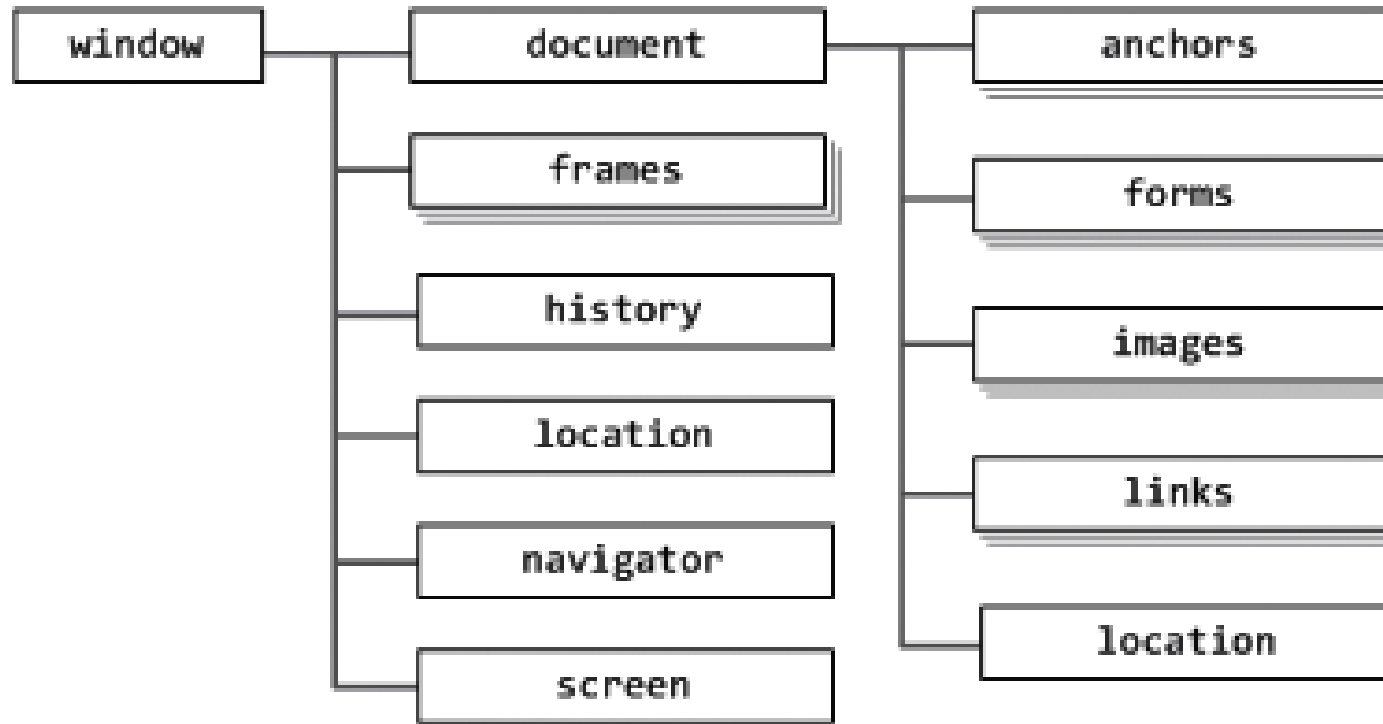

Check your solution here: <https://judge.softuni.bg/Contests/328>

Practice: Document Object Model

Live Exercises in Class (Lab)

Browser Object Model (BOM)

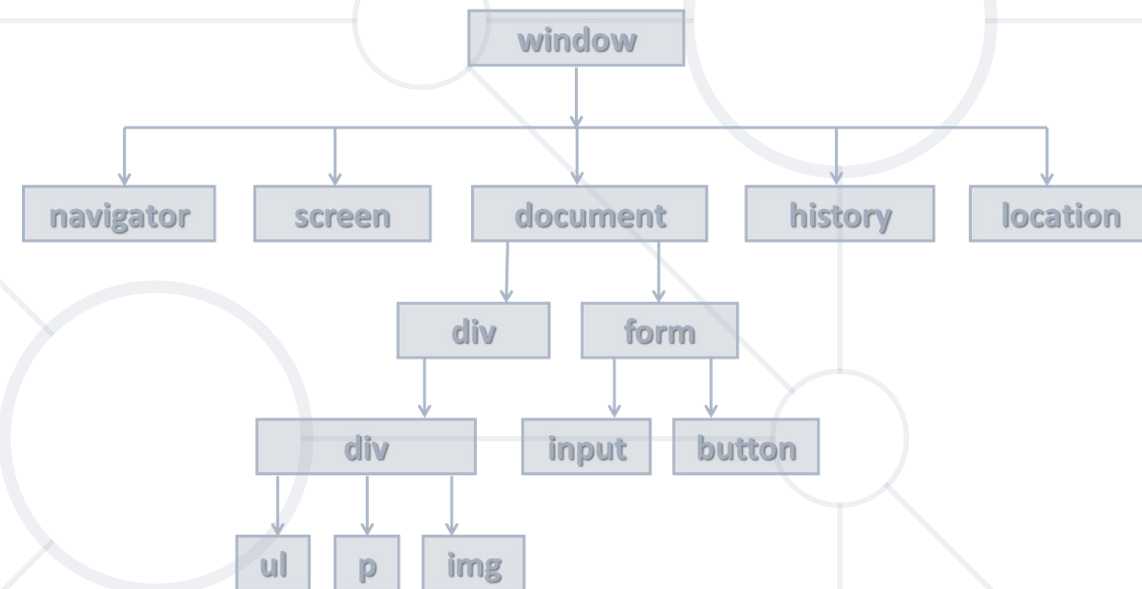

The Built-In Browser Objects

Browser Object Model (BOM)

- Browsers expose some objects like **window**, **screen**, **navigator**, **history**, **location**, **document**, ...

```
console.dir(window);  
console.dir(navigator);  
console.dir(screen);  
console.dir(location);  
console.dir(history);  
console.dir(document);
```

Playing with BOM

```
alert(window.navigator.userAgent);
```

```
console.log(navigator.language);  
// en-US
```

```
console.log(screen.width + " x " + screen.height);  
// 1920 x 1080
```

```
document.location = "https://softuni.bg";
```

```
history.back();
```

This page says:

Mozilla/5.0 (Windows NT 10.0; WOW64) AppleWebKit/
537.36 (KHTML, like Gecko) Chrome/53.0.2785.143 Safari/
537.36

OK

SetInterval() / clearInterval()

- In JS we can start / stop timers (intervals)

```
let intervalID = setInterval(  
  function() {  
    console.log("1 sec. passed");  
  },  
  1000  
); // Delay = 1000 ms = 1 second
```

- Remove (cancel) existing timer

```
clearInterval(intervalID); // Stop the timer
```

Problem: Countdown Timer

- An HTML page contains an empty text **input** field
 - Implement the missing JS function **countdown(startTime)**
 - It takes one **number parameter**, the starting time in seconds
 - **Each second**, it ticks down and **displays the current time** in the input field

```
<input type="text" id="time"
      style="border:3px solid blue;
      text-align:center; font-size:2em;"
      disabled="true"/>
<script>window.onload = function() {
  countdown(600); }</script>
```

Solution: Countdown Timer

```
function countdown(startTime) {  
  let time = startTime;  
  let box = document.getElementById('time');  
  let intervalID = setInterval(decrement, 1000);  
  
  function decrement() {  
    time--;  
    box.value = Math.trunc(time / 60) +  
      ':' + ("0" + (time % 60)).slice(-2);  
  }  
}
```

Check your solution here: <https://judge.softuni.bg/Contests/328>

Problem: Extract Parenthesis

- Extract all **parenthesized text** from a **target** paragraph
 - Your function will receive an element ID to parse
 - Return the result as string, joined by **" ; "**

```
<html>
  <head></head>
  <body>
    <p id="content">
      Rakiya (Bulgarian brandy) is home-made liquor
      (alcoholic drink). It can be made of grapes,
      plums or other fruits (even apples).
    </p>
  </body>
</html>
```

```
>>let text = extract("content")|
```

Bulgarian brandy;
alcoholic drink;
even apples

Problem: Extract Parenthesis (2)

- Sample HTML

```
<p id="content">  
  Rakiya (Bulgarian brandy) is home-made liquor (alcoholic  
  drink). It can be made of grapes, plums or other fruits  
  (even apples).  
</p>  
<p id="holder">  
  Lorem ipsum dolor sit amet, (consectetur adipiscing elit),  
  sed do eiusmod (tempor) incididunt ut labore (et dolore  
  magna) aliqua.  
</p>
```

Solution: Extract Parenthesis

```
function extract(elementId) {  
  let para = document.getElementById(elementId).textContent;  
  let pattern = /\(([^\)]+)\)/g;  
  let result = [];  
  
  let match = pattern.exec(para);  
  while(match) {  
    result.push(match[1]);  
    match = pattern.exec(para);  
  }  
  
  return result.join('; ');  
}
```

Check your solution here: <https://judge.softuni.bg/Contests/328>

Problem: Sum Table

- Find the **first table** and sum all values in the **last column**
- Display the result inside element with ID **"sum"**

Product	Cost
Beer	2.88
Fries	2.15
Burger	4.59
Total:	

Product	Cost
Beer	2.88
Fries	2.15
Burger	4.59
Total:	9.62

Problem: Sum Table (2)

- Sample HTML

```
<table>
  <tbody>
    <tr><th>Product</th><th>Cost</th></tr>
    <tr><td>Beer</td>    <td>2.88</td></tr>
    <tr><td>Fries</td>    <td>2.15</td></tr>
    <tr><td>Burger</td>   <td>4.59</td></tr>
    <tr><td>Total:</td>   <td id="sum"></td></tr>
  </tbody>
</table>
<button onclick="sum()">Sum</button>
```

Solution: Sum Table

```
function sum() {  
  let table = document.querySelectorAll("table tr");  
  let total = 0;  
  for (let i = 1; i < table.length; i++) {  
    let cols = table[i].children;  
    let cost = cols[cols.length - 1].textContent;  
    total += Number(cost);  
  }  
  document.getElementById("sum").textContent = total;  
}
```

Practice: Document Object Model

Live Exercises in Class (Lab)

- Browsers keep elements as DOM tree
- Finding / modifying DOM elements:

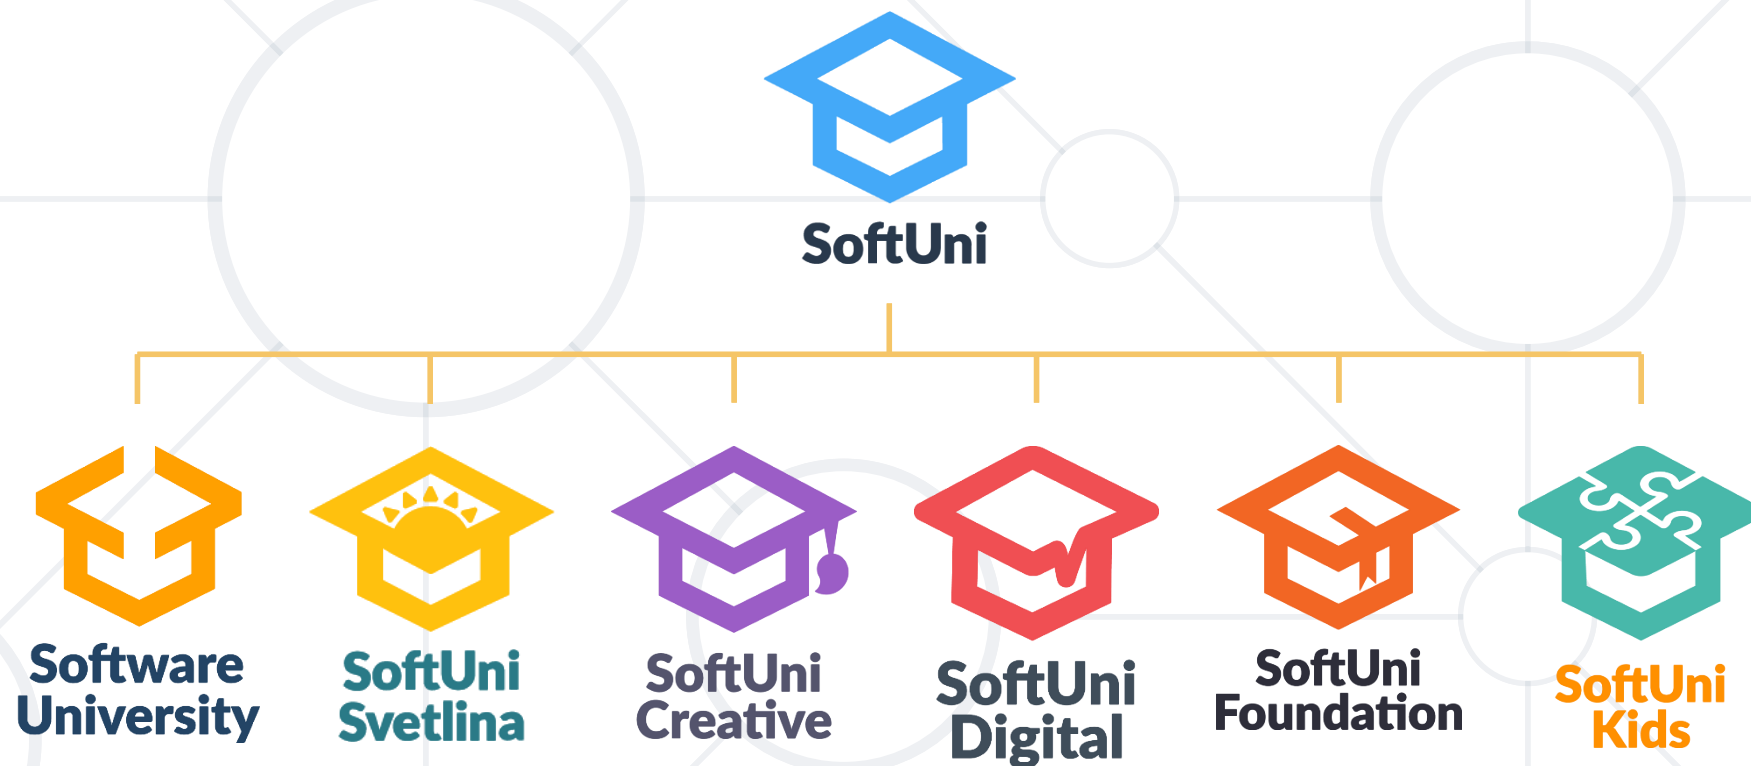

```
let menu = document.getElementById('menu');  
menu.style.display = 'none';  
menu.appendChild(  
    document.createElement('hr'));
```

- Accessing content:

```
let text = element.textContent;  
element.textContent = "Hello, DOM!"
```
